 Natural Resources Canada Ressources naturelles Canada

Introduction

- Diesel oxidation catalysts (DOCs) have been used successfully in the mining industry for a long time to control CO and HC emissions.
- Some older catalyst formulations are known to increase NO₂ which is detrimental to mine air quality.
- Some newer catalyst formulations claim to reduce NO₂ or be NO₂ neutral.
- Most mines do not have a purchasing strategy specific to DOCs so there are large numbers in service without much supporting documentation or performance data.
- A review of DOC technologies is recommended.

Canada

Diesel Oxidation Catalysts (DOC)

- DOCs operate by using the excess oxygen in diesel exhaust to oxidize CO and HC.
- Some catalysts can also oxidize NO to NO₂.

Project Objectives

- Earlier laboratory studies have identified the NO_2 conversion of certain catalyst formulations.
- Unclear how those studies translate into real world, highly transient mining vehicle applications.
- What is the NO_2 formation potential of the different types of DOCs in known vehicle applications?
- Are there certain types that have a higher potential than others?
- Can an evaluation process to deal with the DOCs be developed as a guide to improving air quality?

DOC Selection

- Consortium partner mines removed a selection of DOCs from in-use vehicles underground.
- 32 DOCs sent to CanmetMINING for evaluation.
- 16 were selected as suitable for testing based on type, vehicle application, duty cycle, etc.
- 5 brand new DOCs with advanced NO₂ suppression catalysts were also tested.

New Advanced DOCs

- Several manufacturers were asked to supply a new, advanced formula DOC properly sized for the laboratory engine and designed for an underground LHD cycle.

| CAMIRO - New DOCs for Laboratory Testing | | | | | |
|--|------------------------------------|-------------------------|-------------------|------------|------------|
| DOC # | DOC Make | DOC Model | DOC SN. | Test cycle | Group Type |

Engine testing

- All DOCs tested at CanmetMINING with a laboratory reference engine. (Detroit Diesel Series 60 – 325hp)
- Ten (10) DOCs were from applications with a similar engine rating as the reference engine so they could be tested at full exhaust flow.
- The remaining eleven (11) DOCs came from lower power applications so they were tested at a lower exhaust flow by proportionally bypassing some of the engine exhaust.

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2016

Test Cycles

- Two emissions tests required per DOC
 - Progressive Load Test (PLT)
 - Vehicle Transient Test (VTT)
- Progressive Load Test
 - Standardized test for catalyst performance over a fixed exhaust temperature range.
- Vehicle Transient Test
 - Simulated mining vehicle duty cycles to provide exhaust temperature distribution.
- Combing the two tests allows us to identify potential applications where NO₂ formation is a risk.

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2016

Test Cycles

- Progressive Load Test
 - Constant speed.
 - Increased load and exhaust temperature.

- Vehicle Transient Test
 - Simulated mine vehicle
 - Temperature distribution

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2016

Results

- Vehicle Cycle Tests
 - Each DOC cycle tested according to the vehicle it came from originally.
 - New DOCs were tested on the LHD cycle.
 - Percent change in baseline specific emissions were calculated for each DOC over its representative cycle.

| DOC Number | Mine Engine Rated Power kW | Transient Vehicle Cycle | Percent Change in Exhaust Specific Emission (g/kWh) | | |
|--|----------------------------|-------------------------|---|-----|-----------------|
| | | | CO | THC | NO ₂ |
| In-use DOCs tested with full exhaust flow | | | | | |
| C2 | 242 | LHD | -60 | -45 | -18 |
| C3 | 241 | LHD | -70 | -59 | 32 |
| C15 | 242 | LHD | -49 | -51 | -5 |
| C19 | 241 | LHD | -58 | -49 | -2 |
| C20 | 242 | LHD | -53 | -51 | -17 |
| New DOCs tested with full exhaust flow | | | | | |
| C31 | N/A | LHD | -67 | -62 | -71 |
| C32 | N/A | LHD | -61 | -62 | -81 |
| C33 | N/A | LHD | -6 | -72 | -47 |
| C34 | N/A | LHD | -99 | -68 | 184 |

DOC Classification

- DOC's were classified into three distinct groups based on NO₂ formation.
- **Group 1:** "Active" DOCs greatly increase NO₂
- **Group 2:** "Neutral" DOCs may slightly increase or slightly decrease NO₂ or be NO₂ neutral.
- **Group 3:** "Advanced" DOCs significantly reduce NO₂.

| Group Type | DOC Number | Transient Vehicle Cycle | Critical NO ₂ Temperature (°C) | % change in NO ₂ (g/kWh) |
|------------|------------|-------------------------|---|-------------------------------------|
| 1 | C16 | Utility | 215 | 446 |
| | C21 | Pickup | 220 | 179 |
| | C5 | Utility | 230 | 154 |
| | C34 | LHD | 235 | 184 |
| | C6 | Pickup | 240 | 102 |
| | C3 | LHD | 245 | 32 |
| | C12 | Tractor | 245 | 18 |
| 2 | C18 | Utility | 255 | -2 |
| | C15 | LHD | 280 | -5 |
| | C8 | LHD | 285 | -24 |
| | C2 | LHD | 290 | -18 |
| | C22 | Utility | 295 | 8 |
| | C20 | LHD | 300 | -17 |
| | C14 | Utility | 300 | 9 |
| 3 | C19 | LHD | 320 | -2 |
| | C33 | LHD | 325 | -47 |
| | C17 | Utility | 330 | -37 |
| | C31 | LHD | 335 | -71 |
| | C32 | LHD | 365 | -81 |
| | C35 | LHD | 370 | -94 |
| | C13 | Utility | 415 | -47 |

In-Use Cycle Emissions – C3

- Hydrocarbons

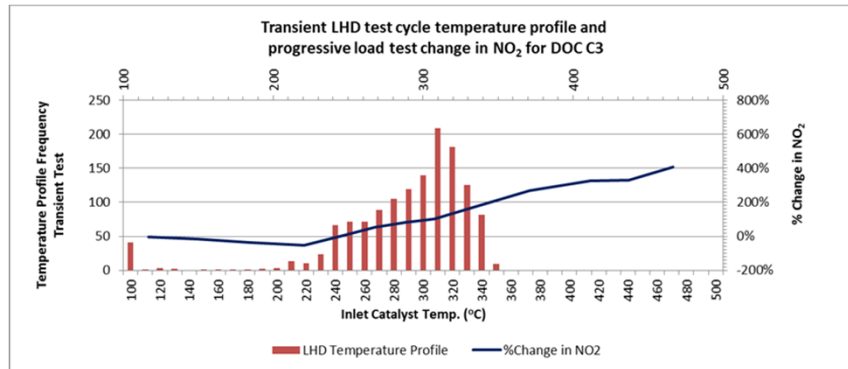

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2016

In-Use Cycle Emissions - C3

- NO₂ emissions

Group 1 "Active" DOC increases NO₂ over the engine operating range.

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2016

Group 2 and 3 DOC NO₂ formation

Group 2 "Neutral" DOC either slightly reduces NO₂, slightly increases NO₂ or remains NO₂ neutral over the vehicle operating range.

Group 3 "Advanced" DOC reduces NO₂ over the entire engine operating range.

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2016

Discussions

- DOCs are readily classified into three major groups based on NO₂ conversion.
 - **Group 1** – “Active” (generally platinum catalyst coatings)
 - **Group 2** – “Neutral” (generally base metal catalyst coatings)
 - **Group 3** – “Advanced” (catalyst coatings not generally known)
- NO₂ conversion is also affected by engine exhaust temperature.
- In use vehicle exhaust temperature is based on the engine loading during the vehicle duty cycle.
- Thus in-use NO₂ formation potential is a combination of DOC group and vehicle duty cycle.
- Can we design an evaluation process to deal with the risk of NO₂ formation from in-use DOCs?

© Her Majesty the Queen in Right of Canada, as represented by the Minister of Natural Resources, 2016

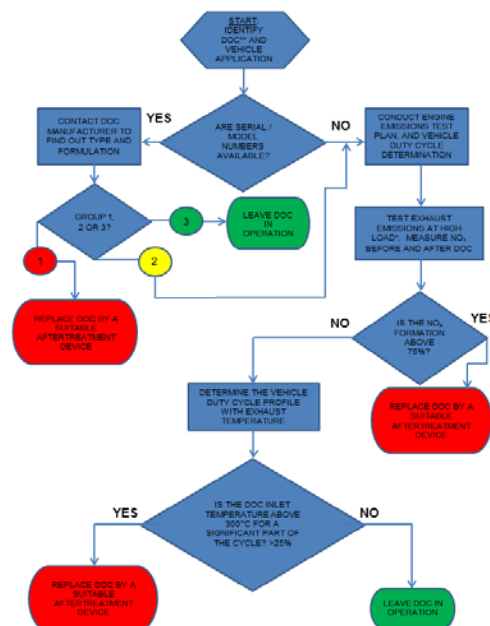

Natural Resources Canada
Ressources naturelles Canada

Canada

DOC Evaluation

- The chart can be used as a basic guide to evaluating the risk of NO₂ formation and developing a plan to deal with DOCs in service.
- **Group 1** DOCs should be removed as they pose the highest risk and better emissions control devices are available.
- **Group 3** DOCs should remain as they are a benefit.
- **Group 2** DOCs need to be evaluated more thoroughly to determine the NO₂ risk.

© Her Majesty the Queen in Right of Canada, as represented by the Minister of

Natural Resources Canada
Ressources naturelles Canada

* The engine emissions test must be performed at high load to ensure the DOC is in its normal operating temperature range. The transmission stall or hydraulic stall tests as mandated by the Ontario MVL are acceptable.
** This chart is derived from limited laboratory testing of selected DOCs.

Recommendations

- The DOC evaluation flow chart can be used by mines to develop a plan for risk assessment of in-service vehicle/DOC applications.
- DOCs can be removed from high risk applications and replaced with new, advanced DOCs or other aftertreatment technologies.
- Mines can revise purchasing plans to only buy the most advanced, NO₂ suppression DOCs.
- These steps will help reduce the underground NO₂ burden and improve mine air quality.
